Student Dropout & Academic Success – Insights Report

Business Question

What factors are associated with student dropout and academic success, and where should the university focus its intervention efforts?

Page 1 - Student Outcomes

1. **Dropout rates vary substantially by age.**

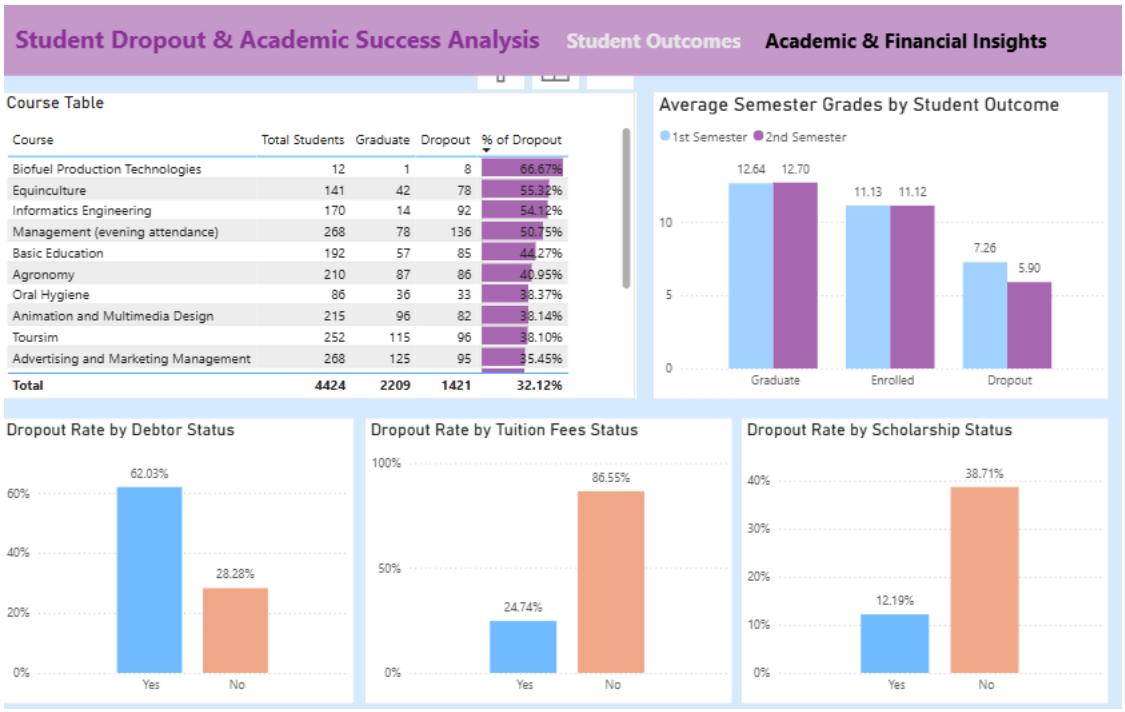

The dropout rate increased from **21.25% among students aged 17–20** to **57.61% among students aged 25-29**. Rates remained above 50% among students aged 25 and older.

Insight: Older students may represent an important group for targeted support. However, age alone cannot determine whether a student is more likely to drop out. Other facts such as **financial circumstances and academic performance** should also be considered.

2. **Some degree programs show elevated dropout rates.**

Equinculture (**55.32%**), Informatics Engineering (**54.12%**), and Management (evening attendance) (**50.75%**) have relatively high dropout rates among meaningful student

populations. Biofuel Production Technologies has the highest rate (**66.67%**), but only 12 students are enrolled, so this result should be interpreted cautiously.

Page 2- Academic & Financial Insights

3. Academic Performance Is Strongly Associated with Dropout

Dropout students had substantially lower average grades than graduates and enrolled students. Their average grade declined from **7.26 in the first semester to 5.90 in the second**, while graduate performance remained relatively stable.

Insight: Early academic performance may be an important indicator for identifying students who could benefit from academic support.

4. The Relationship Between Financial Factors and Dropout Rate

Students whose **tuition fees were not up to date** had an **86.55% dropout rate,** compared with **24.74%** among students whose fees were up to date. Debtor students also had a higher dropout rate **(62.03% vs. 28.28%).** In contrast, students **with scholarships** had a lower dropout rate **(12.19% vs. 38.71%** for **non-scholarship** students).

Insight: Financial circumstances appear to be one of the strongest areas associated with student dropout. This suggests that **early financial support, payment assistance and outreach to students with overstanding tuition payments** could be areas for further investigation.
